**Round table discussion**

### Impossible to “wean” when more aid is needed

Gorik Ooms & Wim Van Damme

Kirigia and Diarra-Nama from the WHO Regional Office for Africa say that funding for health in the WHO Africa Region remains inadequate and that, in some countries, is significantly dependent on donor funding. They propose five strategies for these countries to “wean themselves off” donor funding. While each of the proposed strategies might have some value in itself, they will not succeed in the double objective the authors set: to wean countries from depending upon international health aid and to achieve the US$ 34 per person annual health expenditure target suggested by the Commission on Macroeconomics and Health – an amount that must now be adjusted to US$ 40 due to inflation.

Of the five proposed strategies, only the second and third strategy – reprioritizing public expenditure and raising additional domestic revenue – would increase domestic financial resources for health. The other three strategies (reducing inefficiencies and corruption and increasing private sector involvement in health development) might improve efficiency but would not bring countries closer to the US$ 40 per person annual target. It could be argued that with increased efficiency, less money is required. However, the Commission’s target is based on need and does not factor in inefficiencies or corruption.

Furthermore, even if countries were to reprioritize public expenditure and raise additional domestic revenue, this is unlikely to generate sufficient additional financial resources, particularly for those countries most dependent on international health aid. To test this, we estimated the impact of these two strategies for the 4 countries where – according to the WHO Statistical Information System – the external contribution to total health expenditure exceeded 40% in 2004 (Madagascar, Malawi, Mozambique and Sao Tome and Principe), plus four other countries where the external contribution to total health expenditure exceeded 40% in 2005 (Liberia, Rwanda, Sierra Leone and Zambia).

Kirigia and Diarra-Nama propose reprioritizing public expenditure by adjusting military expenditure to the average of the countries of the WHO African Region. We estimated military expenditure per inhabitant by using data from the CIA of the United States of America – which are expressed as a percentage of GDP – and multiplied those with GDP per capita estimates of the International Monetary Fund. Using the average annual military expenditure of US$ 16 per person provided by Kirigia and Diarra-Nama, we find that the 8 countries of our selection already spend less than US$ 16 per person per year on the military. The proposed strategy would therefore not make a difference (Table 1).

The other strategy proposed to raise domestic financial resources for health is that all countries should aim for government revenue equivalent to 15% of GDP. Five out of the 8 countries of our selection already have higher government revenue equivalent to 15% of GDP. Five out of the 8 countries have higher government revenue equivalent to 15% of GDP.

revenue. Three out of 8 countries would indeed increase financial resources if they followed the recommendation, but even if they spent 15% of these additional financial resources on health – in line with the Abuja Declaration\(^6\) – it would merely raise between US$ 0.8 per person per year (Rwanda) and US$ 1.5 per person per year (Madagascar).

Furthermore, 6 out of these 8 countries still face a huge gap between current total health expenditure and the revised target made by the Commission on Macroeconomics and Health: in Liberia, Madagascar, Malawi, Mozambique, Rwanda and Sierra Leone, total health expenditure is still below US$ 20 per person per year, even with 40% coming from international health aid.

Even if some countries of the African region might be able to wean themselves from international health aid, others obviously cannot: they need increased aid, urgently. This can be achieved through sustained international health aid, which should not be seen as an act of charity to be overcome as soon as possible, but as an act of global solidarity, with health recognized as a human right that entails both national and international duties. For these reasons we agree with the position of WHO's Director-General who has called for much greater, and more predictable, international health aid for Africa.\(^7\) We hope that her voice will be heard and understood throughout WHO and the wider international community. ■
